Location	Description	Category	Resolution
Where issue was found [section/paragraph/req. #]	**Brief description (i.e. few sentences or less) about what the issue is**	**Checklist category/question which led to identification of issue**	**What is (to be) done to fix identified issue, or reasoning why no change is needed**
4.3.1 Description and Priority	The implementation priority of each requirement is not included.	Organization and Completeness	No change is needed because during the elicitation session the user stated that the only priority is for the system to work. Import -> rearrange -> export are all equal.
4. System Features	Algorithms intrinsic to the functional requirements have not been defined	Organization and Completeness	Algorithms for the rearranging feature should be added. However, the algorithm is not constructed yet so will leave at TBD.

Need new section	The specification does not include all of the known customer or system needs.	Organization and Completeness	It is not clear in the SRS document what the specifications are. We will include a separate section for specifications and include the specifications there.
Functional Requirement	The type of the functional requirement is not correct.	Correctness	The older version of the SRS file didn't have the correct type of functional requirement. We will add the correct form of requirement in the SRS file.
5.1 - Performance Requirement	This requirement contains a TBD and a requirement fulfilling the attributes of a requirement was not specified.	Quality Attributes	The performance requirement should be added to the SRS document.
4 Functional Requirement	The test cases from the requirements are identified as TBD	Correctness	The test cases will be changed from TBD to test sample at the time of design phase
Internationalization issues	The internationalization issues have not been addressed in the SRS file yet	Special Issues	There will be another section added for special issues later after having all the test cases and test results.
